VSR
Pre-Shredder

The right tool for tough shredding tasks
Headquarters of BHS-Sonthofen
The Company

BHS-Sonthofen is an owner-operated group of companies specialized in machinery and plant engineering. The group is headquartered in Sonthofen, Germany. BHS provides technical solutions for mechanical process engineering with a focus on mixing, crushing, recycling and filtration technologies. BHS-Sonthofen has a global presence with more than 400 employees and several subsidiaries.

More than 100 Years of Experience in Crushing Technology

100 years have already passed since we built the first crushers for the aggregates industry. We have been producing innovative crushing machines for the recycling industry for around 20 years. Our acquisition of the AMNI Maschinenbau GmbH product range means that we have rounded out our portfolio with the addition of cutting technologies. The AMNI machine technology is based on many years of experience and extensive practical applications. Given this range of products and expertise, we are a true technology innovator and experienced system supplier for any recycling application.

Global Service

We provide fast and reliable service around the world, complete with technical customer support and a large inventory of spare parts for all common machine types including older models.

BHS Pre-Shredder

The Pre-Shredder is a low-speed, high-torque twin-shaft shredder. Each shaft is equipped with rotating tools that reliably tear the feed material. The machine is suitable for the pre-shredding of particularly bulky or voluminous materials (such as domestic, industrial, commercial and bulky waste, as well as construction waste).
On-Target Shredding Results
The first process step in the mechanical processing or thermal utilization of waste materials is to reduce and homogenize the particle size of the feed material. The pre-shredder shreds the feed material to the desired granulation to ensure trouble-free downstream processing.

Doubly Effective Shredding Capability
Shredding takes place between the rotating tools and the stationary tearing table, or a crossbeam under the shafts. This means that even a partial rotation of the shaft results in very intensive shredding.

Forward-Reverse Sequence
During operation, the machine automatically carries out a sequence involving different inward and outward directions of rotation. This produces intensive shredding results, even with very coarse feed material, and helps to prevent material build-up.

Low Operating Costs
The load of the rotating and stationary tearing tools is distributed evenly across its entire length. In many cases, both the rotor shafts and shredding table can be regenerated by hard-face welding.

High System Availability
The Pre-Shredder is designed to maximize system availability and ensure a long service life of wear parts. The rotor shafts can be replaced in just four hours. This is facilitated by the proven quick changing system.

High Throughput Rates
The machine is equipped with a robust, high-torque drive. This facilitates high throughput rates. The machine can be used in three-shift operation without difficulty.

Flexibility
The Pre-Shredder is capable of processing a broad range of feed materials. Due to the relatively large shaft diameters, the tearing tools can safely process even voluminous or bulky feed material.

One-Piece Machine Housing
The machine housing is designed as a highly robust, one-piece, welded steel construction. There are no screw connections, as these are prone to causing malfunctions. This construction also guarantees a long service life of the machine.
MACHINE DESIGN

1 Infeed Hopper
The machine is equipped with a large, central infeed hopper. In addition to standard solutions, customer-specific hoppers are also available.

2 Machine Housing
The machine housing is designed as a highly robust, one-piece, welded steel construction. This allows the machine to absorb extremely high forces without difficulty.

3 Tearing Tools
Shredding takes place between the shafts equipped with tearing tools and on the tearing table, or a crossbeam and scraper. The machine can be equipped with tearing tools specifically suited to the feed material. These tools differ in diameter and shape. The tearing table is built in a way that accommodates this variety.

4 Drive System
Each shaft is powered independently. The machine drive can be driven hydraulically or electromagnetically. In both cases, the drive system consists of standard industrial drives and a variable speed controller. The control and drive system can alternate the rotor direction to adapt to the shredding material.

5 Hydraulic Pusher Unit
A hydraulic pusher device is available as an option. It ensures continuous material infeed when processing low-density, light or bulky feed stock.
Tearing Table or Crossbeam

The tearing table, or crossbeam and scraper, is designed as a one-piece unit and located below the two rotor shafts. It can be easily removed and replaced to accommodate shaft changing.

Shaft Changing

When the infeed hopper has been disassembled, the rotor shafts equipped with their quick coupling are exposed. The quick coupling is screw-fastened and makes shaft changing possible without having to disassemble the drive system. The rotor shafts are easy to remove.
**Functional Description**

Both rotor shafts take in the feed material. The shafts rotate alternately inward and outward. Each shaft is equipped with several tearing tools. The rotating tearing tool is surrounded by a stationary tearing table, or a crossbeam and scraper. Shredding takes place between the individual rotating tearing tools and the stationary assemblies. In the process, the machine automatically carries out a sequence involving different directions of rotation. As soon as the feed material has reached the desired size, it exits the machine through the bottom.
EXAMPLES OF USE

Pre-Shredder VSR 1215 with discharge belt

Shredding big electronic appliances
APPLICATION EXAMPLES

Domestic & commercial waste  Bulky waste  Scrap wood

Electronic waste  Plastics  Non-ferrous metals
